4 Conclusion

Motivation

The problem

- State the problem in one line that a non-specialist understands
- Say who is affected, and how much
- Resist the urge to explain your method here

- Supporting detail, with a citation [1]
- A second point, **emphasised** where it matters

Background I

What is already known

- One finding per line, each attached to its source [2]
- Keep lines short enough to read from the back of the room

What is not known

- The gap your work fills, stated as plainly as you can manage

Contents

1 Introduction

2 Methodology

3 Results

4 Conclusion

Approach

Steps

- Data collection
- Pre-processing
- Model fitting
- Validation

Why this way

- A reason, not a restatement
- The alternative you rejected

A figure

Figure 1: Replace this with your own figure. Captions are numbered automatically.

An equation

One displayed equation per slide is usually the limit an audience can absorb:

$$\hat{y} = \sigma\left(\beta_0 + \sum_{i=1}^{n} \beta_i x_i\right) \tag{1}$$

Define every symbol you use, in words, immediately after it.

4 Conclusion

Results

Model	Accuracy	AUC
Baseline	0.71	0.74
Proposed	0.83	0.88

Table 1: Keep tables small. If it needs a scrollbar, it needs a figure instead.

What the numbers mean

- Say what the reader should take away before they work it out themselves
- Note the comparison that makes the number meaningful

Contents

1 Introduction

2 Methodology

3 Results

4 Conclusion

Conclusion

Contributions

- What exists now that did not exist before your work

Limitations

- Name them yourself — an examiner who finds one you missed trusts the rest less

Next

- The question you would answer with another six months

Thank you
